WWI

TRANSMITTING EQUIPMENT
FOR THE
ABSORPTION MEASUREMENT PROJECT

NATIONAL BUREAU OF STANDARDS
WASHINGTON, D.C.
The function of the equipment described in this report is to emit radio waves of five frequencies in the 2-9 Mc range, day and night, continuously over a period of years. These waves are emitted at Beltsville, Maryland, and are received at Sterling, Virginia, where the field intensities are recorded continuously. These measurements provide data from which an analysis of the absorption of radio waves reflected from the ionosphere at vertical incidence may be made. Because the absorption is higher at the lower frequencies, two types of transmitters are employed. Transmitter, type A, used in the 4-9 Mc range, operates at a power output of approximately 200 watts; while transmitter, type B, used in the 2-3 Mc range, supplies 400 watts of output power. The call letters WWI have been assigned to the National Bureau of Standards for all transmissions in connection with this project. For the purposes of analysis of the data it is desirable to have regular intervals of a few minutes duration during which no transmission takes place. It is also necessary to identify the carriers at regular intervals. Control equipment, therefore, has been designed to operate the station on a regular schedule.
II. Operating Schedule

At all times of the day and night station WNI broadcasts a continuous carrier, which is interrupted at regular intervals as follows:

Beginning on the hour and every five minutes thereafter there is a keying interval of twenty seconds during which the station call letters are transmitted in International Morse Code.

Beginning on the hour and every twenty minutes thereafter the carrier is off the air for five minutes, with the exception of the keying interval indicated above.

III. Transmitter, Type A

Three type A transmitters operate continuously in the 4, 6, and 7 megacycle bands, while a fourth is used as a standby transmitter. With the exception of the plug-in type coils and crystals, the four transmitters are identical in every respect (Fig. 1). Each transmitter contains four integral units and connections between units are of the plug-and-jack type so that any unit may be removed or replaced in a short time (Fig. 2). The circuits employed are conventional (Fig. 3). The oscillator-amplifier unit consists of a 6L6 crystal-controlled oscillator and a single 613 class C power amplifier (Figs. 4 and 5). The low-voltage power supply is the source of all the oscillator-stage supply voltages and provides the amplifier stage with filament voltage and fixed grid bias (Figs. 7 and 8). Plate and screen voltages for the power amplifier are obtained from the high-voltage power supply (Fig. 10). The panel meters serve as a check on the operation of the transmitters and as an aid in servicing. The transmitter is keyed in the cathode circuit of the oscillator.

A. Transmitter, Type A. Operating Instructions

The location of the controls and switches is shown in Figs. 1 and 2. The main power plug K15 plugs into the receptacle in the channel. Switches S3 and S2, which control filament and bias supply, should be thrown on, allowing about a minute for the tube filaments to heat up. The oscillator plate supply switch S1 should be turned on and oscillator plate condenser C1 tuned through resonance as indicated by the dip on the reading of the oscillator plate current meter M1. The current should change sharply on one side of the minimum value and slowly on the other. The proper setting of C1 is for plate current slightly greater than the minimum value on the low capacity or slowly changing side of the dip. It is essential that switch S2 which controls the amplifier grid bias be on before the high voltage is turned on. The variac control T6 should be turned to less than half scale, thus reducing the power amplifier plate voltage so that an excessive amount of plate current will not flow when the amplifier is detuned. The high-voltage switch S4 should then be turned on.
The power amplifier tuning condenser \( C_4 \) is then tuned for minimum plate current. Next, the antenna tuning unit \( C_7 \) is tuned for maximum antenna current. The power amplifier and oscillator should then be retuned. When the transmitter is properly tuned, the variac control \( T_6 \) should be advanced until the power amplifier plate voltage reaches its normal operating value.

B. Parts List, Transmitter, Type A.

Condensers

\( C_1 \) - 150-\( \mu \)f variable - National TMC 150.
\( C_2 \) - 0.0001-\( \mu \)f mica, 1000-volt.
\( C_3 \) - 0.002-\( \mu \)f mica, 1000-volt.
\( C_4 \) - 100-\( \mu \)f variable, 6000-volt - National TMA-100A.
\( C_5 \), \( C_6 \) - 0.01-\( \mu \)f mica, 600-volt.
\( C_7 \), \( C_8 \) - 0.002-\( \mu \)f mica, 600-volt.
\( C_9 \) - 0.005-\( \mu \)f mica, 6000-volt - Radio Wire Television K3763.
\( C_{10} \) - 1-\( \mu \)f Dykanol, 1000-volt - Cornell-Dubilier TLA-10010.
\( C_{11} \), \( C_{12} \), \( C_{13} \), \( C_{14} \) - 2-\( \mu \)f Dykanol, 600-volt - Cornell-Dubilier TLA-6020.
\( C_{15} \) - 2-\( \mu \)f Dykanol, 3000-volt - Cornell-Dubilier TJU-30020.
\( C_{16} \) - 4-\( \mu \)f Dykanol, 3000-volt - Cornell-Dubilier TJU-30040.
\( C_{17} \) - 230-\( \mu \)f variable, 6000-volt - National TMA-230A.

Fuses

\( F_1 \) - 15-amp. fuse plug with receptacle.
\( F_2 \) - 7/8-amp. - Littlefuse 1338.
\( F_3 \) - 1/16-amp. 1000-volt - Littlefuse 2013.
\( F_4 \) - 1/4-amp. 5000-volt - Littlefuse 3022.

Pilot Bulbs

\( J_1 \) - 60 ma. - Mazda 48.
\( J_2 \), \( J_3 \), \( J_4 \), \( J_5 \) - 120-volt, 6-watt - Mazda S-6.

Connectors

\( K_1 \) - 2-contact female, cable mounting - Amphenol MC2F.
\( K_2 \) - 2-contact male, chassis mounting - Amphenol PC2M.
\( K_3 \) - 8-contact male, chassis mounting - Amphenol P08M.
\( K_4 \) - 8-contact female, cable mounting - Amphenol C8F1.
\( K_5 \) - 8-contact male, cable mounting - Amphenol O8M.
\( K_6 \) - 8-contact female, chassis mounting - Amphenol P08F.
\( K_7 \), \( K_8 \) = phone jack, single closed-circuit.
\( K_9 \), \( K_{10} \), \( K_{11} \) = phone plug.
\( K_{12} \) = duplex convenience outlet.
\( K_{13} \) = 110-volt male plug.
\( K_{14} \) = 110-volt female cable mounting plug.
\( K_{15} \) = 110-volt recessed chassis mounting male plug.
\( K_{16} \) = heavy-duty 110-volt male plug - GE 59197.
\( K_{17} \) = phone jack adapted for use in circuit.
Inductances

L1, L2 = 2.5 mH, RF choke - Bud CH920-W.
L3 - oscillator tank coil for operating frequency.
L4 - amplifier tank coil for operating frequency.
L5 - link to antenna tuning unit.
L6 - 8-mH. RF choke - Bud CH1215.
L7 - 1-mH. 300-ma. RF choke - National B-300U.
L8, L9 = 12-h. 150-ma. filter choke - Thordarson T17000-B.
L10 - 22-h. 35-ma. filter choke - Thordarson T18092.
L11 - 12-h. 300-ma. filter choke - General Electric 69G51.
L12 - 12-h. 300-ma. filter choke - General Electric 69G51.
L13 - coil for antenna tuning unit - same as L4.

Meters

M1 - 0-100 ma. d.c. - Triplett 327A.
M2, M3 - 0-25 ma. d.c. - Triplett 327A.
M4 - 0-300 ma. d.c. - Triplett 327A.
M5 - 0-3000 volt d.c. with multiplier - Triplett 327A.
M6 - 0-15 volt a.c. - Triplett 337A.
M7, M8 - RF ammeter with suitable range - Triplett 347A.

Resistors

R1 - 50,000-ohm, 1-watt.
R2, R3 = 1000-ohm, 10-watt.
R4 = 50,000-ohm, 100-watt adjustable - IRC type HAA.
R5 = 25,000-ohm, 50-watt adjustable - Ohmite 0585.
R6 = 75,000-ohm, 200-watt adjustable - Ohmite 1372.
R7 - external resistor supplied with M5.
R8 - 10-ohm, 10-watt.

Switches

S1, S2 - d.p.s.t. toggle switch - 5-ampere - Radio Wire Television 12814.
S3, S4 - d.p.s.t. toggle switch - 10-ampere - Radio Wire Television 12816.
S5 - door interlock - Bud SW1270.

Transformers

T1 - 10-volt, 8-amp. filament supply - Thordarson T19F96.
T2 - oscillator supply - Thordarson T13R16.
T3 - grid bias supply - Thordarson T13R12.
T4 = 2.5-volt, 10-amp. filament supply - Thordarson T19F90.
T5 - high-voltage power supply - GE 78G301.
T6 - variac General Radio type 100Q.

Relay

U1 - 110-volt a.c. "break" keying relay - Leech 1177ABF.
Crystal

X₁ - quartz crystal for operating frequency, with holder.

C. Additional Parts.

Tubes

1 - type 6GL.
1 - type 618.
1 - type 523.
1 - type 8Q.
2 - type 866.

Tube Sockets

2 - 3-prong - Amphenol RSS8.
2 - 4-prong - Amphenol RSS4.
1 - 7-pin giant - RCA 9929.
2 - rectifier tube sockets - National XM-10.

Plug-in coil Assemblies

2 - 3-inch ribbed coil forms - National XR-10A.
1 - oscillator coil socket - National XB-16.
1 - oscillator coil plug base - National PB-16.
2 - amplifier and antenna coil mounting plugs - National PB-15.
2 - amplifier and antenna coil bases - National XB-15.

Enclosed Cabinet Rack

1 - 66½" cabinet - Bud CR-1772.

Metal Panels

3 - 5½" enclosed meter panels - Bud PS439.
1 - 10½" panel - Bud PS1255.
1 - 3½" panel - Bud PS1251.
1 - 5¼" panel - Bud PS1252.
3 - 8 3/4" panels - Bud PS1254.

Chassis

3 - 10"x17"x3" black crackle finish - Bud CB-655.
1 - rack shelf for high-voltage power supply - Bud CB-1976.

Mounting Brackets

3 pr. - 8½" high, 10" deep - Bud MB-448.
1 pr. - 6½" high, 13" deep - Bud MB-460.
1 pr. - supporting angles for rack shelf - Bud SA-1349.
Insulators

2 - antenna feed-through - Johnson 10060.
1 - high-voltage feed-through - Johnson 42J.
18 or 16 - 3/4" stand-off - National 8S10.
10 - 1/2" stand-off - Birnbach 432.
4 - 1" narrow stand-off for 913 socket.

Miscellaneous Parts

1 - interstage shield - Bud IS-1247.
1 - 1" jewel assembly, red - Dialex 910CF.
1 - 1" jewel assembly, amber - Dialex 910CF.
1 - 1" jewel assembly, green - Dialex 910CF.
1 - 1" jewel assembly, blue - Dialex 910CF.
3 - insulated shaft couplings - National TX-9.
1 - pilot light base for 60-ma. bulb.
3 - panel bearings for condenser shaft - Bud PB-531.
3 - 2 3/4" tuning dials - Bud D-1732.
1 - buckwheat coal blower (Sears).

Trouble                                      Probable Cause

No grid bias voltage on 813 tube.              Defective grid coil L2;
                                                defective meter jack K9;
                                                open meter M2;
                                                open connection in connectors K3, K4, K5, K6, K7 or supply cable;
                                                open filter choke L15;
                                                defective 80 tube;
                                                open bleeder R5;
                                                defective transformer T3;
                                                defective switch S2.

813 plate current high.                       Shorted bypass condenser C9;
Blows fuse F4.                                shorted coupling condenser C2;
                                                plate circuit not tuned to oscillator frequency;
                                                no grid bias.

813 screen current high.                     Shorted bypass condenser C3;
                                                shorted coupling condenser C2.

Transmitter does not load up on antenna.     Link coupling L5 on coil L4 out of
                                                adjustment;
                                                open antenna current meter M7 or M8;
                                                antenna tuning unit not tuned to trans-
                                                mittor frequency;
                                                wrong coil plugged in L13 socket;
                                                faulty connection to transmission line.

IV. Transmitter, Type B.

Two type B transmitters were built for operation in the 2-3 megacycle
range. The two transmitters are perfectly identical with the exception of
the plug-in type coils and crystals (Fig. 12). Each transmitter is made
up of five integral units. Connections between units are of the plug-and-
jack type which makes it possible to replace any unit in a short time
(Fig. 13). The power amplifier unit consists of two 813 tubes operating
in push-pull (Figs. 15 and 16). An 807 tube operating in class C serves
as buffer and a 6S5 as oscillator (Figs. 18 and 19). All the supply volt-
ages for the oscillator-buffer unit as well as the filament and grid bias
for the power amplifier are furnished by the low-voltage power supply
(Figs. 21 and 22). The oscillator supply voltage is well regulated by
the circuit using the 2A3 tube, 6S57 tube, and the 1-watt neon bulb.
(Fig. 14). Plate and screen voltages for the power amplifier are obtained
from the high-voltage power supply (Fig. 24). The transmitter is keyed
in the grid circuit of the buffer stage by the blocked grid method of
keying. The eleven panel meters serve as an aid in checking the opera-
tion and adjustment of the transmitter.

A. Transmitter, Type B, Operating Instructions.

The location of the controls and switches is shown in Figs. 12 and 13.
The main power plug K24 plugs into the receptacle in the channel. The
master switch S5 should now be thrown on. Switches S1 and S2 which control the filaments of the 866 and 813 tubes along with the oscillator and buffer supply voltages may now be turned on.

The oscillator plate condenser C1 should now be tuned through resonance indicated by a dip on the reading of the oscillator plate current meter M1. The current should change sharply on one side of the minimum value and slowly on the other. C1 should be adjusted for a value of plate current slightly greater than minimum on the slowly changing or low-capacity side. The buffer plate condenser C2 may then be tuned for minimum value reading on the buffer plate meter M4. The power amplifier grid condenser C3 is then tuned to resonance as indicated by a maximum reading on power amplifier grid current meter M7. Readjustment should now be made on the oscillator and buffer tuning.

It is essential that switches S1 and S2 be on before the high voltage is turned on. The variac control T3 should be turned to less than half-scale in order to keep the plate voltage low to prevent an excessive amount of plate current from flowing while the amplifier is detuned. The high-voltage switch S3 may then be turned on.

The power-amplifier tuning condenser C4 is then tuned for minimum plate current. The antenna tuning condenser C5 is then tuned for maximum antenna current. With the transmitter properly tuned the variac control T3 should be advanced until the power amplifier plate voltmeter M6 reads 2000 volts. The coupling between antenna tuning coil L5 and link coil L6 should be adjusted for best efficiency and loading.

B. Parts List, Transmitter, Type B.

Condensers

C1 - 150-µf variable - National TMC150.
C2 - 300-µf variable - National TMC300.
C3 - split stator, 100-µf per section - National TMC100D.
C4 - split stator, 110-µf per section - Hammond TCD110-H.
C5 - 230-µf variable - National TMA230A.
C6 - 0.00002 mica.
C7 - 0.005-µf, mica.
C8 - 0.002-µf, mica.
C9 - 0.005-µf, mica.

C11 - 0.005-µf, mica, 1000-v.
C12 - 0.002-µf, mica.
C13 - 0.005-µf, mica.
C14 - 0.002-µf, mica.
C15 - 0.005-µf, mica, 1000-v.
C16 - 0.005-µf, mica, 1000-v.
C17 - 0.002-µf, mica.
C18 - 0.005-µf, mica, 2500-v.
C19 - 2-µf Dykanol, 1000-v. - Cornell-Dubilier TLA-10020.
Condensers (continued)

C20 = 2-µf Dykanol, 1000-v. - Cornell-Dubilier TLA-10020.
C21 = 2-µf Dykanol, 600-v. - Cornell-Dubilier TLA-6020.
C22 = 2-µf Dykanol, 600-v. - Cornell-Dubilier TLA-6020.
C23 = 2-µf Dykanol, 3000-v. - Cornell-Dubilier TJU-30020.
C24 = 4-µf Dykanol, 3000-v. - Cornell-Dubilier TJU-30040.

Fuses

F1 = 15-amp. cartridge-type fuse.

Pilot Bulbs

J1 = 60-ma. - Mazda #48.
J2, J3, J4 = 120-volt, 6-watt - Mazda S-6.

Connectors

K1 = 8-contact male chassis connector - Amphenol P08M.
K2 = 8-contact female cable connector - Amphenol 08Fl.
K3 = 8-contact male cable connector - Amphenol 08M.
K4 = 8-contact female chassis connector - Amphenol P08F.
K5 = 4-contact female chassis connector - Amphenol P04F.
K6 = 4-contact male cable connector - Amphenol 04M.
K7 = 4-contact female cable connector - Amphenol 04Fl.
K8 = 2-contact male chassis connector - Amphenol P04M.
K9 = 2-contact male chassis connector - Amphenol PC2M.
K10, 11, 12, 13, 14, 15, 16 = phone plug.
K17, 18, 19, 20, 21, 22, 23 = phone jack adapted for circuit.
K24 = 117-volt male plug - heavy-duty - GE59197.
K25 = duplex convenience outlet.
K26 = 2-contact 117-v. female cable connector - GE1351.
K27 = 2-contact 117-v. male chassis mounting plug - GE2291.

Inductances

L1 = oscillator tank coil - Bud OCL-160.
L2 = buffer tank coil - Bud OCL-160.
L3 = P.A. grid coil - Bud OCL-160.
L4 = P.A. tank coil - Bud MCL-160.
L5 = antenna tuning coil - Bud MLA-1.
L6 = variable link assembly - Bud AM-1964.
L7, 8, 9, 10 = 2.5-mh. RF choke - Bud CH920-W.
L12 = 2.5-mh. 300-ma. RF choke - National R-300U.
L13 = 4-mh. 600-ma. RF choke - National R-152.
L14,15 = 12-h. 150-ma. filter choke - Thordarson T17C00-B.
L16,17 = 22-h. 35-ma. filter choke - Thordarson T18C92.
L18,19 = 20-h. 500-ma. choke - G.E. 69G49.
Meters

| M1 | 0-25 ma. d.c. | Triplet 327-A. |

| R5 | 35,000-ohm, 10-watt. |
| R6 | 20,000-ohm, 10-watt. |
| R7 | external series resistor supplied with M8. |
| R8 | 50,000-ohm, 100-watt adjustable - IRC type HAA. |
| R9 | 25,000-ohm, 50-watt adjustable - Ohmite 0585. |
| R10 | 0.5-megohm, 1-watt. |
| R11 | 10,000-ohm, 10-watt. |
| R12 | 25,000-ohm, 10-watt. |
| R13 | 10,000-ohm potentiometer. |
| R14 | 50,000-ohm, 10-watt. |
| R15 | 50,000-ohm, 200-watt adjustable - Ohmite 1371. |
| R16 | 7-ohm, 20-watt. |

Switches

| S1 | d.p.s.t. toggle switch, 5 amp. | Radio Wire Television 12814. |
| S2, S3 | d.p.s.t. toggle switch, 10 amp. | Radio Wire Television 12816. |
| S4 | door interlock switch | Bud SW1270. |
| S5 | enclosed switch and fuse holder | Arrow Hart & Hegeman 27202. |

Transformers

| T1 | oscillator, buffer and bias supply | Thordarson T89R29. |
| T2 | 2.5-v. filament transformer | Thordarson T19F90. |
| T3 | auto-transformer | General Radio 100Q Variac. |
| T4 | 2.5-v. filament transformer | Thordarson T19F90. |
| T5 | 2350-0-2350 high-voltage supply | G.E. 78G302. |
| T6 | 10-v. filament supply | Thordarson T19F87. |

Relay

| U1 | 110-v. a.c. "break" keying relay | Leach 1177ABF. |
Crystal

$X_1$ - quartz crystal for operating frequency, with holder.

C. Miscellaneous Parts

1 - interstage shield - Bud IS-1247.
1 - 1" jewel assembly, red - Dialex 910CF.
1 - 1" jewel assembly, green - Dialex 910CF.
1 - 1" jewel assembly, blue - Dialex 910CF.
4 - insulated shaft couplings - National TX-9.
1 - pilot light base for 60-ma. bulb.
4 - panel bearings for condenser shaft - Bud PB-531.
4 - tuning dials - National type 0 scale 2.
25 ft - No. 14 twin-conductor lead-covered cable.
Miscellaneous wire and hardware.
1 - 1-watt neon bulb - adapted to circuit requirements.

D. Transmitter, Type B, Service Notes.

V. Control Equipment

Control equipment for the transmitters consists of an automatic keying device, a transmitter control unit, and a Hammerlund model HQ120 receiver (Figs. 26 and 27).

A. Automatic Keying Device.

In the automatic keying device, in Figs. 28 and 29, a revolving code wheel is used to make and break contactor K1. This causes the code wheel output terminals to be short-circuited as the dots and dashes on the code
wheel pass under contactor K1.

This device is so designed that it will not start keying the transmitters in the middle of a code group or discontinue keying them, after the 20-second keying interval, until a complete code group (which consists of the call letters WWI) has gone under contactor K1. This is accomplished by use of a holding relay which is energized by contactor K2 falling into a cam just before a code group on the code wheel reaches contactor K1. The circuit through the holding relay coil is opened by contactor K3, which is pushed open by a bakelite pin on the side of the code wheel. This happens just after a complete code group has gone under contactor K1. With the relay in a relaxed position the circuit from contactor K1 to the code-wheel output terminals is open. When the holding relay is energized by contactor K2 one set of its contacts completes the circuit from contactor K1 to the code-wheel output terminals, another set of its contacts serves to keep the contactor of cam C in the transmitter control unit short-circuited. Another set of contacts is necessary to lock the holding relay.

If contactor K1 is in the middle of a code group at the end of the 20-second keying interval (controlled by the transmitter control unit), the holding relay, which has a set of contacts short-circuiting the contactor of cam C in the transmitter control unit (Fig. 31), will prevent the transmitter control unit from stopping the keying interval until the complete code group has gone under contactor K1. After a complete code group has gone under contactor K1 the bakelite pin on the side of the code wheel will push contactor K3 apart to take the energy off the holding relay and discontinue the keying interval.

The code wheel and cam are motor-driven.

B. Transmitter Control Unit:

A photograph and circuit diagram of the transmitter control unit are shown in Figs. 30 and 31. When relay 2 is energized by the contactor of cam C, 110 volts is applied to the keying-motor input terminals by one set of the relay contacts. The other set of contacts, on relay 2, short-circuits the contactors of cams A and B, which puts 110 volts on the transmitter relays to cut the transmitters off the air until the keying device short-circuits the code input terminals.

When the code input terminals of the transmitter control unit are short-circuited by the automatic keying device the coil of relay 1 is energized. This breaks the circuit and takes the 110 volts off the transmitter relays, therefore causing the transmitters to be keyed according to the dots and dashes on the code wheel in the automatic keying device.

The 5-minute interval when the transmitters are off the air is controlled by cams A and B. The contactors of these two cams are connected in series. Both contactors have to be closed for the transmitters to be off the air. When the contactor falls into cam A, it closes, and 110 volts is put on the transmitter relays, which causes the transmitters to go off the air. Five minutes later the contactor falls into cam B. This removes
the 110 volts and puts the transmitters back on the air. The cams are
driven by a Telechron clock motor.

The Telechron clock and cam mechanism may be set to the correct time
by loosening the set screw on the motor side of the shaft coupling. The
cams may then be revolved by turning the shaft coupling in a counter-
clockwise direction facing the clock motor shaft. The cams should be
revolved until the contactor falls into cam A; at the same time the con-
tactor of cam C will fall in. The control unit is now set for the begin-
ing of an off-the-air interval. (See operating schedule). If another
setting is desired the cam mechanism may be rotated further. After this
setting is passed, five minutes may be added to the time every time the
contactor of cam C falls in. The mechanism should be left a few seconds
on the fast side. The set screw should now be tightened and the control
unit put in operation. The 110-volt a-c line plug may be taken out and
left out for the number of seconds the unit is found to be fast. The
time may be checked with WWV.

When the manual keying switch on the front panel of the control unit
is turned on, the transmitters will continuously key the station call let-
ters. The other switch on the front panel is an on-off switch which when
turned off will remove the power from everything in the unit except the
Telechron clock motor. The three pilot lights tell what is going on in
the unit. When the red light is on, the transmitters are off the air.
The green light indicates that the control unit is turned on. When the
amber light is on, the transmitters are keying.

C. Receiver.

The Hammarlund model HQ120 receiver is used for monitoring the trans-
mitters. A schematic of this receiver can be seen in Fig. 32.

VI. Power Wiring

The power wiring runs from the circuit breaker on the main WWV switch-
board through the channel and is brought out through the metal channel
plates in which are mounted five 30-ampere receptacles (Fig. 30). An extra
length of wire is left in the channel to allow for the plates being re-
moved. The circuit breaker will trip when a load requiring more than
35 amperes is connected to one phase.

A. Power System Parts List

350 ft. No. 3 insulated wire.
50 ft. No. 4 insulated wire.
6 General Electric SP52C15 galvanized covers.
6 General Electric SP52151 galvanized boxes.
6 General Electric 59197 polarity caps.
6 GE 996 receptacles.
6 GE 997 flush plates
6 - 3/4-inch close nipples.
5 - 1/2-inch close nipples.
1 - 1-inch close nipple.
6 - 3/4-inch bushings.
5 - 1/2-inch bushings.
1 - 1-inch bushing.
12 - 3/4-inch locknuts.
10 - 1/2-inch locknuts.
2 - 1-inch locknuts.

VII. Antenna System.

Half-wave dipole antennas with a height of one-quarter wavelength above ground are used in order to get good vertical radiation. A map of this antenna system is shown in Fig. 35. All of the antennas except the 2-Mc one point in the direction of the receiving station. The 2-Mc antenna is broadside to the receiving station. Radiation patterns for the antennas are shown in Fig. 37. Fig. 36 shows the construction details. Wire connectors are used at the point where the transmission line connects to the antenna. The connectors are of a type which can conveniently be disconnected to insert ammeters at the center of the antenna for the determination of radiated power.

Resonant lines are used in order that frequencies may be changed quickly and conveniently by retuning the transmission line.

A. Antenna System Parts List.

2 - 160-ft wooden masts with guy wires and hardware.
2 - 82-ft wooden masts with hardware.
9 - 65-ft wooden poles with hardware.
1 - 35-ft wooden pole with hardware.
10 - 19-ft wooden poles with hardware.
7 - 15½-ft wooden poles with hardware.
10 - 6½x4"x3" cross-arms with braces and hardware.
4 - 8½x4"x3" cross-arms with braces and hardware.
16 - 2½x4"x3" cross-arms with braces and hardware.
1 - 3½x4"x3" cross-arm with braces and hardware.
600 ft - No. 10 galvanized iron wire.
1400 ft - No. 10 Copperweld wire.
1500 ft - No. 12 Copperweld wire.
10 - eye bolts, 3/8" shank.
10 - screw eyes, 3/8" shank.
30 - turnbuckles, 3/8" screw diameter, 11½" open.
10 sets - Johnson #52 feed-thru insulators.
30 - 7½" strain insulators - Pyrex 67017.
36 - 4" standoff insulators with hole - Radio Wire Television 16800.
18 - 6" standoff insulators.
50 - compression-type strain insulators - Knox 500.
20 - 6" spreader insulators.
20 - wire connectors.
Miscellaneous hardware.
